Michael Angelo S. Calzado

2024-10-16

1. The table below shows the data about shoe size and height. Create a data frame.

```
Table <- data.frame(</pre>
 Shoe_size = c(6.5, 9.0, 8.5, 8.5, 10.5, 7.0, 9.5, 9.0, 13.0, 7.5, 10.5, 8.5, 12.0, 10.5, 13.0, 11.5,
 Height = c(66.0, 68.0, 64.5, 65.0, 70.0, 64.0, 70.0, 71.0, 72.0, 64.0, 74.5, 67.0, 71.0, 71.0, 77.0,
 )
Table

```

a. Describe the data.

The data frame Table contains three columns: Shoe size, Height, and Gender.

Shoe_size: A numeric vector representing the shoe sizes of individuals. The values range from 5.0 to 13.0. Height: A numeric vector representing the height of individuals in inches. The values range from 59.0 to 77.0

inches. Gender: A categorical variable indicating the gender of each individual, with values "M" for male and "F" for female.

b. Create a subset by males and females with their corresponding shoe size and height. What its result? Show the R scripts.

```
maledata <- subset(Table, Gender = "M", select = c(Shoe_size, Height))</pre>
## Warning: In subset.data.frame(Table, Gender = "M", select = c(Shoe_size,
       Height)) :
    extra argument 'Gender' will be disregarded

  c. Find the mean of shoe size and height of the respondents. Write the R scripts and its result.
meanmaleshoesize <- mean(maledata$Shoe_size)</pre>
meanfemaleshoesize <- mean(femaledata$Shoe_size)</pre>
meanmaleheight <- mean(maledata$Height)</pre>
meanfemaleheight <- mean(femaledata$Height)</pre>
print("Mean female's shoe size")
## [1] "Mean female's shoe size"
meanfemaleshoesize
## [1] 9.410714
print("Mean male's shoe size")
## [1] "Mean male's shoe size"
meanmaleshoesize
## [1] 9.410714
print("Mean female's heights")
## [1] "Mean female's heights"
meanfemaleheight
## [1] 68.57143
print("Mean male's heights")
## [1] "Mean male's heights"
meanmaleheight
```

[1] 68.57143

d. Is there a relationship between shoe size and height? Why? There appears to be a positive relationship between shoe size and height, as individuals with larger shoe sizes generally have greater heights. This is because larger shoe sizes typically accommodate taller individuals who tend to have longer feet.

Figure 1: Household Data

Factors A nominal variable is a categorical variable without an implied order. This means that it is impossible to say that 'one is worth more than the other'. In contrast, ordinal variables do have a natural ordering. Example: Gender <- c("M", "F", "F", "M") factor_Gender <- factor(Gender) factor_Gender

[1] M F F M

Levels: F M

2. Construct character vector months to a factor with factor() and assign the result to factor_months_vector. Print out factor_months_vector and assert that R prints out the factor levels below the actual values. Consider data consisting of the names of months: "March", "April", "January", "November", "January", "September", "October", "September", "November", "August", "January", "November", "February", "May", "August", "July", "December", "August", "August", "September", "November", "Novembe

```
months_vector <- c("March", "April", "January", "November", "January", "September", "October", "Septemb
cat("Vector:")
## Vector:

```

Using Conditional Statements (IF-ELSE) 6. Full Search Exhaustive search is a methodology for finding an answer by exploring all possible cases. When trying to find a desired number in a set of given numbers, the method of finding the corresponding number by checking all elements in the set one by one can be called an exhaustive search. Implement an exhaustive search function that meets the input/output conditions below. a. Create an R Program that allows the User to randomly select numbers from 1 to 50. Then display the chosen number. If the number is beyond the range of the selected choice, it will have to display a string "The number selected is beyond the range of 1 to 50". If number 20 is inputted by the User, it will have to display "TRUE", otherwise display the input number.

```
exhaustivesearch <- function() {
   chosen_number <- as.integer(readline(prompt = "Enter a number between 1 and 50: "))

# Check if the input is NA
   if (is.na(chosen_number)) {
      print("Invalid input. Please enter a valid number.")
   } else if (chosen_number < 1 || chosen_number > 50) {
      print("The number selected is beyond the range of 1 to 50")
   } else if (chosen_number == 20) {
      print("TRUE")
   } else {
      print(paste("The chosen number is:", chosen_number))
   }
}
```

- ## Enter a number between 1 and 50:
 ## [1] "Invalid input. Please enter a valid number."
 - 7. Change At ISATU University's traditional cafeteria, snacks can only be purchased with bills. A long-standing rule at the concession stand is that snacks must be purchased with as few coins as possible. There are three types of bills: 50 pesos, 100 pesos, 200 pesos, 500 pesos, 1000 pesos.
 - a. Write a function that prints the minimum number of bills that must be paid, given the price of the snack. Input: Price of snack (a random number divisible by 50) Output: Minimum number of bills

needed to purchase a snack.

```
min_bills <- function(price) {</pre>
  bills <- c(1000, 500, 200, 100, 50)
  count <- 0
  for (bill in bills) {
    while (price >= bill) {
      price <- price - bill</pre>
      count <- count + 1</pre>
    }
  }
  return(count)
snack_price <- as.integer(readline(prompt = "Enter the price of the snack (multiple of 50): "))</pre>
## Enter the price of the snack (multiple of 50):
if (is.na(snack_price)) {
  cat("Invalid input. Please enter a valid number.\n")
} else if (snack_price %% 50 == 0) {
  min_count <- min_bills(snack_price)</pre>
  cat("Minimum number of bills needed:", min_count, "\n")
} else {
  cat("The price must be a multiple of 50.\n")
```

Invalid input. Please enter a valid number.

8. The following is each student's math score for one semester. Based on this, answer the following questions.

Name Grade1 Grade2 Grade3 Grade4 Annie 85 65 85 100 Thea 65 75 90 90 Steve 75 55 80 85 Hanna 95 75 100 90 a. Create a dataframe from the above table. Write the R codes and its output.

```
students <- data.frame(
   Name = c("Annie", "John", "Lisa", "Tom"),
   Grade1 = c(95, 85, 92, 75),
   Grade2 = c(90, 88, 94, 80),
   Grade3 = c(88, 82, 90, 78),
   Grade4 = c(92, 85, 85, 70)
)
students</pre>
```

```
##
      Name Grade1 Grade2 Grade3 Grade4
## 1 Annie
                95
                        90
                                88
                                       92
## 2
      John
                85
                        88
                                82
                                       85
## 3
      Lisa
                92
                        94
                                90
                                       85
## 4
                75
                                78
       Tom
                        80
                                       70
```

b. Without using the rowMean function, output the average score of students whose average math score over 90 points during the semester. write R code and its output. Example Output: Annie's average grade this semester is 88.75.

```
\texttt{students\$Average} \gets (\texttt{students\$Grade1} + \texttt{students\$Grade2} + \texttt{students\$Grade3} + \texttt{students\$Grade4}) \neq \texttt{students\$Grade4}) + \texttt{students\$Grade4} + \texttt{students\$Grade4}) + \texttt{students\$Grade4} + \texttt{students} + \texttt{
```

```
for (i in 1:nrow(students)) {
   if (students$Average[i] > 90) {
     cat(students$Name[i], "'s average grade this semester is", round(students$Average[i], 2), "\n")
   }
}
## Annie 's average grade this semester is 91.25
```

c. Without using the mean function, output as follows for the tests in which the average score was less than 80 out of 4 tests. Example output: The nth test was difficult.

d. Without using the max function, output as follows for students whose highest score for a semester exceeds 90 points. Example Output: Annie's highest grade this semester is 95.

```
for (i in 1:nrow(students)) {
  highest_score <- students[i, 2]
  for (j in 3:5) {
    if (students[i, j] > highest_score) {
      highest_score <- students[i, j]
    }
  }
  if (highest_score > 90) {
    cat(students$Name[i], "'s highest grade this semester is", highest_score, "\n")
  }
}
```

Annie 's highest grade this semester is 95
Lisa 's highest grade this semester is 94

Lisa 's average grade this semester is 90.25
